AQTOR now ten times faster

Leading trading software firm Actant (www.actant.com) today announces that their flagship trading application AQTOR is now up to ten times faster in terms of quote and order execution turnaround time.

This was measured from a change in the underlying market to an automated option quote sent out from a market maker using AQTOR.

The faster turnaround time is designed into the latest release of AQTOR's version 3.68 release. While Actant's speciality options quotation, execution and risk management software was already a market leader, the latest version is a breakthrough boost to system performance. It is a result of the continuous effort to keep AQTOR the fastest trading system and involves everything from further optimisation to redesign of components.

A wide range of powerful new features across both its core functionality and individual markets are added to the latest release. These include:

- Optimised Valuation Time Decay
- Improved Risk Management
- Enhanced Volatility Smoothing
- Customised Script Function Calls

Stig Hubertsson, CEO Actant said, "As our clients have always expected us to deliver the fastest trading software available, we are very happy to outperform even the greatest expectations with our new release. Once again we have proved that, more than ever in today's markets, "Speed Matters".

Notes for editors
